[57] ABSTRACT

PURPOSE: To improve the performance of a whole system without sending each command when a prescribed procedure is used by providing a function for memorizing and reproducing a series of recording/reproducing procedures on the information recording/reproducing device.

CONSTITUTION: The command of a stored procedure indicating that it is an operation for memorizing a series of prescribed recording/reproducing procedures (routine procedures) is issued by a host computer 1 and then, a commandstring including the procedure identification of the routine procedure to be memorized is given as data. Data inputted to the information recording/reproducing device is stored in a nonvolatile RAM 6 or an optical disk 7 by a CPU 3. On the other hand, when the routine procedure is reproduced, a procedure reproducing command is issued and a procedure identifier is sent by the host computer 1. Thus, the routine procedure stored in the RAM 6N or the optical disk 7 is called by the CPU 3 and its command is automatically executed.
